

1 **ABSTRACT**

2 In a networked client/server system, live presentations can be streamed
3 from an encoder or other server to a client computer. Additionally, information
4 describing the presentation is registered with a search server. This information is
5 made available for user searches only for as long as the information properly
6 describes the live presentation. When the information no longer describes a
7 current live presentation, the information is no longer available for searching.
